

15-CH PROGRAMMABLE CAPACITIVE TOUCH SENSOR

Preliminary Information January 2019

GENERAL DESCRIPTION

The IS32SE5114 is an ultra-low power, fully integrated 15-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric such as glass or plastic. On-chip calibration logic continuously monitors the environment and automatically adjusts on-and-off threshold levels to prevent false sensor activation.

The IS32SE5114 supports the 400kHz I²C serial bus data protocol and includes a field programmable slave address. An INTB is generated when a button event (touched or released) occurs, triggered and cleared condition could be configured by setting the interrupt register.

The built-in LCD controller can support up to 8 common and 28 segment output with $\frac{1}{2}$, $\frac{1}{3}$ or $\frac{1}{4}$ bias. When configured as LED controller, it supports a direct-drive mode that can drive up to 8 SEG by 15 digits with 64-level brightness control.

Many peripheral functions are also embedded in the chip such as UART, EUART with LIN capability, one I2C master/slave and two I2C pure slave controllers, one SPI master/slave controller, PWMs, GPIOs, etc. Unused touch key and/or LED/LCD pins can be programmed for selected I/O function. User can refer to the Technical Reference Manual, TRM-5114_R1 for detail.

IS32SE5114 is available in LQFP-64 package. It operates from 2.7V to 5.5V over the temperature range of -40°C to +105°C.

FEATURES

- Fifteen sensors capacitive touch controller with readable key value through shared GPIO
- Individual sensitivity threshold setting for each key
- Optional multiple-key function
- Press and hold function
- Automatic calibration
- Individual key calibration
- Interrupt output with auto-clear and repeating
- Auto sleep mode for extremely low power
- Keys wake up from sleep mode
- 400kHz fast-mode I²C interface
- One SPI master/slave controllers
- One 8051 UART
- One full-duplex LIN-capable EUART2
- LCD Controller
 - 32 x 4, 31 x 5, 30 x 6, 29 x 7, 28 x 8
 - $\frac{1}{2}$, $\frac{1}{3}$ or $\frac{1}{4}$ bias and 8 brightness
- LED Controller
 - Up to 8 SEG x 15 DIGIT common cathode direct drive
 - Up to 8 COM x 28 SEG external drive
 - Programmable 64 brightness
- Operating temperature is -40°C ~ +105°C
- AEC-Q100 qualification in progress
- LQFP-64 package

APPLICATIONS

- Automotive control keys
- Automotive infotainment panel
- Automotive air condition keys

TYPICAL APPLICATION CIRCUIT (LQFP-64)

Figure 1 Typical Application Circuit (LQFP-64)

Note 1: The IC should be placed far away from the noise points in order to prevent the EMI. **Note 2:** The R_s and C_s should place as close to IC as possible to reduce EMI.

PIN CONFIGURATION

IS32SE5114

PIN DESCRIPTION

No.	Pin	Description
8, 42	VCC	Power supply.
4 – 7	SEG24 – SEG27	These pins can be configured as LED/LCD SEG driver.
9 – 12	SEG28 – SEG31 / COM7 -COM4	These pins can be configured as LED/LCD SEG driver. These pins can be configured as LED/LCD COM driver.
13 – 16	COM3 – COM0	These pins can be configured as LED/LCD COM driver.
17 – 23	SEG12, SEG10,, SGE0	These pins can be configured as LED/LCD SEG driver.
25 – 31	SEG 1, SEG3,, SEG13	These pins can be configured as LED/LCD SEG driver.
32 – 41	SEG14 – SEG23	These pins can be configured as LED/LCD SEG driver.
44	RSTN	Reset Low Active.
62	Cref	External Capacitor.
46	SCL	I2C serial clock.

33	INTB	Interrupt output, active low.
34	AD	I2C address setting.
45	SDA	I2C serial data
61 – 47	KEY0 – KEY14	Input sense channel 0 - 14
1,2, 3, 24, 64	VSS	Ground.
43	VDDC	Typical decoupling capacitors of $0.1\mu F$ and $10\mu F$ should be connected between VDDC and GND.

ABSOLUTE MAXIMUM RATINGS

Supply voltage, Vcc	-0.3V ~ +6.0V
Voltage at any input pin	-0.3V ~ Vcc+0.3V
Maximum junction temperature, TJMAX	+150°C
Storage temperature range, Tstg	-65°C ~ +150°C
Operating temperature range, T _A =T _J	-40°C ~ +105°C
Junction Package thermal resistance, junction to ambient (4 layer standard test PCB based on JESD 51-2A), θ_{JA}	53.84°C/W
Package thermal resistance, junction to thermal PAD (4 layer standard test PCB based on JESD 51-8), θ_{JP}	0.3809°C/W
ESD (HBM)	±2kV
ESD (CDM)	±750V

Note 3: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other condition beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

 $T_A = 25^{\circ}C$, $V_{CC} = 2.7V \sim 5.5V$, unless otherwise noted. Typical value are $T_A = 25^{\circ}C$, $V_{CC} = 3.6V$.

Symbol	Parameter	Condition	Min.	Тур.	Max.	Unit
Vcc	Supply voltage		2.7		5.5	V
lcc	Quiescent power supply current	$V_{CC} = 5.5V$		100		μA
I _{SD}	Shutdown current	$V_{CC} = 5.5V$		15		μA
ΔC_S	Minimum detectable capacitance	$C_{S} = 5pF$ (Note 4)		0.2		pF
Logic Elect	rical Characteristics					
VIL	Logic "0" input voltage	$V_{CC} = 2.7 V$			0.4	V
Vih	Logic "1" input voltage	$V_{CC} = 5.5V$	1.4			V
lıL	Logic "0" input current	$V_{INPUT} = 0V (Note 4)$		5		nA
I _{IH}	Logic "1" input current	V _{INPUT} = V _{CC} (Note 4)		5		nA

DIGITAL INPUT SWITCHING CHARACTERISTICS (Note 4)

Symbol	Parameter	Condition	Min.	Тур.	Max.	Unit
f _{SCL}	Serial-Clock frequency				400	kHz
t BUF	Bus free time between a STOP and a START condition		1.3			μs
t _{HD, STA}	Hold time (repeated) START condition		0.6			μs
tsu, sta	Repeated START condition setup time		0.6			μs
tsu, sto	STOP condition setup time		0.6			μs
t _{HD, DAT}	Data hold time				0.9	μs
tsu, dat	Data setup time		100			ns
tLOW	SCL clock low period		1.3			μs
t _{ніGH}	SCL clock high period		0.7			μs
t _R	Rise time of both SDA and SCL signals, receiving	(Note 5)		20+0.1Cb	300	ns
t⊧	Fall time of both SDA and SCL signals, receiving	(Note 5)		20+0.1C _b	300	ns

Note 4: Guaranteed by design.

Note 5: C_b = total capacitance of one bus line in pF. $I_{SINK} \le 6mA$. t_R and t_F measured between 0.3 × V_{CC} and 0.7 × V_{CC} .

FUNCTIONAL BLOCK DIAGRAM

DETAILED DESCRIPTION

I2C INTERFACE

The IS32SE5114 uses a serial bus, which conforms to the I2C protocol, to control the chip's functions with two wires: SCL and SDA. The IS32SE5114 has a 7-bit slave address (A7:A1), followed by the R/W bit, A0. Set A0 to "0" for a write command and set A0 to "1" for a read command. The value of bits A1 and A2 are decided by the connection of the AD pin.

The complete slave address is:

Table 1 Slave Address

Bit	A7:A3	A2:A1	A0
Value	01111	AD	1/0

AD connected to GND, AD = 00;

AD connected to VCC, AD = 11;

AD connected to SCL, AD = 01;

AD connected to SDA, AD = 10;

The SCL line is uni-directional. The SDA line is bi-directional (open-collector) with a pull-up resistor (typically 4.7k Ω). The maximum clock frequency specified by the I2C standard is 400kHz. In this discussion, the master is the microcontroller and the slave is the IS32SE5114.

The timing diagram for the I2C is shown in Figure 2. The SDA is latched in on the stable high level of the SCL. When there is no interface activity, the SDA line should be held high.

The "START" signal is generated by lowering the SDA signal while the SCL signal is high. The start signal will alert all devices attached to the I2C bus to check the incoming address against their own chip address.

The 8-bit chip address is sent next, most significant bit first. Each address bit must be stable while the SCL level is high.

After the last bit of the chip address is sent, the master checks for the IS32SE5114's acknowledge. The master releases the SDA line high (through a pull-up resistor). Then the master sends an SCL pulse. If the IS32SE5114 has received the address correctly, then it holds the SDA line low during the SCL pulse. If the SDA line is not low, then the master should send a "STOP" signal (discussed later) and abort the transfer.

Following acknowledge of IS32SE5114, the register address byte is sent, most significant bit first. IS32SE5114 must generate another acknowledge indicating that the register address has been received.

Then 8-bit of data byte are sent next, most significant bit first. Each data bit should be valid while the SCL level is stable high. After the data byte is sent, the IS32SE5114 must generate another acknowledge to indicate that the data was received.

The "STOP" signal ends the transfer. To signal "STOP", the SDA signal goes high while the SCL signal is high.

READING PORT REGISTERS

To read the device data, the bus master must first send

the IS32SE5114 address with the R/W bit set to "0", followed by the command byte, which determines which register is accessed. After a restart, the bus master must then send the IS32SE5114 address with

the R/W bit set to "1". Data from the register defined by the command byte is then sent from the IS32SE5114 to the master (Figure 5).

IS32SE5114 GUI

IS32SE5114 GUI is a windows-based Integrated Design Environment (IDE). User can use it to develop touch key applications without firmware coding. With the GUI user can design the touch key system easily. With the GUI you can:

- 1. Monitor the Key value
- 2. Set touch threshold and enable keys
- 3. Switch the operating modes
- 4. Tune System parameters

FUNCTIONAL DEFINITOIN of KEY PERIPHRALS

The IS32SE5114 is a capacitive touch-sensing controller with MCU. The MCU is based on 1-T 8051 core. Embedded in the MCU core are also a full-duplex UART port, an enhanced EUART port with LIN capability, one I2C master/slave and two I2C pure slave controllers, one SPI marter/slave controller, up to 20 GPIO pins

GPIO

Each GPIO is controlled by two registers. One is IOCFGPx.y (I/O Configuration) and the other is MFCFGPx.y (Multifunction Configuration).

Figure 6 I/O Configuration

Figure 6 shows that there are 7 control bits for the IOCFGPx.y register, and these registers are located at XFR 0xA040 – 0xA047 for P0.0 to P0.7, 0xA048 – 0xA04F for P1.0 to P1.7, 0xA060 – 0xA063 for P2.0 to P2.3.

GPIO Port Multi-Function

Each signal pin is multi-functional and the pin configuration is specified by MFCFGP register. There are 7 control bits for the MFCFGPx.y register, and these registers are located at XFR 0xA050 - 0xA057 for P0.0 to P0.7, 0xA058 - 0xA05F for P1.0 to P1.7, and 0xA070 - 0xA073 for P2.0 to P2.3.

The touch keys and GPIO mapping table are as follows:

Touch KEY No.	GPIO Port
KEY0	P0.1
KEY1	P0.2
KEY2	P0.3
KEY3	P0.4
KEY4	P0.5
KEY5	P0.6
KEY6	P0.7
KEY7	P1.0

KEY8	P1.1
KEY9	P1.2
KEY10	P1.3
KEY11	P1.4
KEY12	P1.5
KEY13	P1.6
KEY14	P1.7

Serial Port – UART0

UARTO is full duplex and fully compatible with the standard 8052 UART. The receive path of UARTO is double-buffered that can commence reception of second byte before previously received byte is read from the receive register. Writing to SBUFO loads the transmit register while reading SBUFO, reads a physically separate receive register. The UARTO can operate in four modes.

The touch keys related function and UART0 pins mapping table are as follows:

Touch KEY No.	GPIO Port
KEY4	P0.5/RX0
KEY5	P0.6/TX0

To use UART0 function, IOCFGP0.4, IOCFGP0.5, MFCFGP0.4, and MFCFGP0.5 should be defined in advance to enable UART0.

MFCFGP0.5 (0xA055h) GPIO P0.5 Function Configuration Register R/W (0x00)

	7	6	5	4	3	2	1	0
RD	-	-	-	RXD0EN	-	-	-	GPIOEN
WR	-	-	-	RXD0EN	-	-	-	GPIOEN

 RXD0EN
 RXD0EN=1 uses this pin as RXD input for UART0

 GPIOEN
 GPIO Function Enable Bit. Set this bit to enable GPIO function. DISABLE is the default value.

MFCFGP0.6 (0xA056h) GPIO P0.6 Function Configuration Register R/W (0x00)

	7	6	5	4	3	2	1	0
RD	-	-	-	TXD0EN	-	-	-	GPIOEN

TXD0EN GPIOEN TXD0EN=1 uses this pin as TXD output for UART0

GPIO Function Enable Bit. Set this bit to enable GPIO function. DISABLE is the default value.

To enable UART0, four GPIO related configuration registers, the setting is as follows:

Register Name	Value
IOCFGP0.4	0xA0 (input only)
IOCFGP0.5	0x06 (output pin)
MFCFGP0.4	0x10
MFCFGP0.5	0x10

EUART2 with LIN Controller (EUART2)

LIN-capable 16550-like EUART2 is an enhanced UART controller (EUART) with separate transmit and receive FIFOs. Both transmit and receive FIFOs are 15-bytes deep and can be parameterized for interrupt triggering. The addition of FIFO significantly reduces the CPU load to handle high-speed serial interface. Transmit FIFO and receive FIFO have respective interrupt trigger levels that can be set based on optimal CPU performance adjustment. EUART2 also has dedicated 16-bit Baud Rate generator and thus provides accurate baud rate under wide range of system clock frequency. EUART2 also provides LIN extensions that incorporate message handling and baud-rate synchronization. The block diagram of EUART2 is shown in the following.

EUART2 can be configured to add LIN capability. The major enhancement of LIN includes master/slave configurations, auto baud-rate synchronization, and frame-based protocol with header. Under LIN extension mode, all EUART2 registers and functions are still effective and operational. LIN is a single-wire bus and it requires external components to combine RX and TX signals externally. LIN is frame based and consists of message protocols with master/slave configurations.

The touch keys related function and UART2/LIN pins mapping table are as follows:

Touch KEY No.	GPIO Port
KEY5	P0.6/RX2
KEY6	P0.7/TX2

To use UART2 function, IOCFGP0.5, IOCFGP0.6, MFCFGP0.5, and MFCFGP0.6 should be defined in advance to enable UART2.

MFCFGP0.6 (0xA056h) GPIO P0.6 Function Configuration Register R/W (0x00)

	7	6	5	4	3	2	1	0	
RD	-	-	-	-	RXD2EN	-	-	GPIOEN	
WR	-	-	-	-	RXD2EN	-	-	GPIOEN	

RXD2EN GPIOEN RXD2EN=1 use this pin as RXD input for EUART2

GPIO Function Enable Bit. Set this bit to enable GPIO function. DISABLE is the default value.

MFCFGP0.7 (0xA057h) GPIO P0.7 Function Configuration Register R/W (0x00)

	7	6	5	4	3	2	1	0
RD	-	-	-	-	TXD2EN	-	-	GPIOEN
WR	-	-	-	-	TXD2EN	-	-	GPIOEN

TXD2EN GPIOEN TXD2EN=1 uses this pin as TXD output for EUART2

GPIO Function Enable Bit. Set this bit to enable GPIO function. DISABLE is the default value.

To enable EUART2/LIN, four GPIO related configuration registers, the setting is as follows:

Register Name	Value
IOCFGP0.5	0xA0 (input only)
IOCFGP0.6	0x06 (output pin)
MFCFGP0.5	0x08
MFCFGP0.6	0x08

Serial Peripheral Interface (SPI)

The Serial Peripheral Interface (SPI) is an enhanced synchronous serial hardware which is compatible with Motorola's SPI specifications. The SPI Controller includes a 4-byte FIFO for both transmit and receive. SPI Interface uses Master-Out-Slave-In (MOSI), Master-In-Slave-Out (MISO), Serial Clock (SCK) and Slave Select (SSN) for interface. SSN is low active and only meaningful in slave mode.

The touch keys related function and SPI pins mapping table are as follows:

Touch KEY No.	GPIO Port
SDA, INTB	P2.1, P3.3 (MISO)
SCL, AD	P2.0, P3.2 (MOSI)
KEY5, KEY14	P0.6, P1.7 (SCK)
CREF	P0.0 (SSN)

LED/LCD controller

The LCD/LED Controller supports up to maximum 240 dots with 8 COM and 30 SEG. Driving duty cycle methods include static, ½, 1/3, ¼, 1/5, 1/6, 1/7, 1/8, and programmable ½, ⅓ and ¼ bias with 12-level brightness control. The clock sources of LCD/LED controller can be selected either from RTC or from SIOSC, and support display frame rate down to 1Hz. When configured in LED mode, it supports either direct-driving or external-driving modes. In LCD mode, the LCD controller can be left running during STOP or SLEEP mode. The current consumption of LCD controller is about 10uA.

LED Drive Mode

Direct Drive Mode

SE5114 support LED direct drive with common-cathode LED driving without external transistors. This mode is enabled by setting MODE[1-0]=11 in LCDCSH register. The LED is configured as 8-segment digit display and up to 15 digits. The display data are stored in DISPDAT[15-0]. These are scanned out on COM[7-0] and SEG[0-14] are enabled scanned sequentially. The resulting duty cycle of the LED is thus 1/SEG[0-14] depending on the number of SEG enabled.

The COM outputs are used to drive the segments and the SEG outputs are used to drive the digits. COM outputs have high PMOS drive (up to 25mA source current with RDSON of 200hm for 85C, and up to 20mA for

110C) and SEG outputs have high NMOS drive (up to 125mA sink current with RDSON of 8 Ohm for 85C, and up to 125mA for 110C), thus is suited to drive common-cathode LED arrays. A typical application circuit showing the LED array and associated scanning waveform is shown in the following diagram.

Since each SEG output needs to sink up to 8 LED if all COM output is enabled, the total sink current must be less than 8 x of COM source current. For sink current up to 125mA, the LED current thus should be limited to 125mA/8 = 16mA. Then the average LED current can be derived as $16mA \times Duty$ Cycle. For example, total 10 digits are enabled then the average LED current is 1.6mA.

External Drive Mode

For higher LED brightness requirement, SE5114 also supports external drive mode to increase the average LED current. In this mode, COM[0-7] is scanned and enabled sequentially while SEG output are output accordingly. As the result, the on duty cycle of LED is 1/COM[0-7] depending on the number of enabled COM outputs. This is set by LCDDTY[2-0] and ranges from 0 (static) to 1/8th. This mode can support up to 4 x 32 or 8

x 28 LED matrix array. This mode is enabled by setting MODE[1-0]=10 in LCDCSH register. The application circuits and corresponding scan timing of external drive mode is shown in the following diagram.

In the example, COM output is connected to external PNP or PMOS transistor to supply LED current. In this case, COM output polarity must be set in order to obtain correct driving signals. When PNP is used, maximum LED brightness should be set to 63/64 in order to avoid ghosting due to PNP extended turn-off delay. Alternatively, NPN transistors can also be used. NPN transistor can also serve as high voltage blocking function for LED array.

External drive mode can provide significant higher LED average current for several reasons. First, source current limitation is removed. Secondly, scanning COM makes the effective duty on cycle higher (static to $1/8^{th}$). The sink current is determined by the maximum drive capability of SEG driver (up to 125mA for SEG[14-0] output driver), and GPIO driver (up to 50mA for SEG[15-31]) if total segment count is more than 15. And the maximum current for PNP/PMOS drive is the number of the segments times the LED on current. Using an 8 by 27 array as an example, the maximum LED on current is then 50mA. And the PNP/PMOS maximum current is 50mA * 27 = 1.35A. And because the duty cycle 1/8th, the effective LED average current is 125mA * 14 = 1.68A. And the effective LED average current is 128mA/8 = 15.6mA.

TYPICAL APPLICATION INFORMATION

GENERAL DESCRIPTION

The IS32SE5114 is an ultra low power, fully integrated 15-channel solution for capacitive touch-buttons applications. The chip allows electrodes to project sense fields through any dielectric such as glass or plastic.

SENSITIVITY ADJUSTING

Sensitivity can be adjusted by the external capacitor

or internal register.

The value of capacitor is higher the sensitivity is lower; value of capacitor is lower the sensitivity is higher.

INTERRUPTION

The changing of action can be signed by the INTB pin. The INTB pin will be pulled low when sensitivity channel is pressed or released.

SHUTDOWN MODE

Shutdown mode can be used as a means of reducing power consumption. During shutdown mode all registers retain their data.

Software Shutdown

By setting SDM bit of the Configuration Register (00h) to "1", the IS32SE5114 will operate in software shutdown mode.
